COMMITS	FILES CHANGED	LINES ADDED	LINES REMOVED

Of these, 10 commits (41 files, +1,372 / −142) are the work from this session. The other 6 were already in `main` before it (Oct 28 to 29).

1. What changed, in short

AREA	WHAT IT DOES NOW
Phone numbers	One Philippine mobile rule everywhere: `+63`, then 10 digits starting with 9. Applies to customers, employees, applicants, emergency contacts and the public application form, on both the form and the API. Suppliers keep their landline rule.
Employees dashboard	The Day shift, Night shift, role and position cards filter the list and scroll to it.
Dashboard cards	Cards open the matching page and list, with a cyan pulse on the destination. More cards now filter their own page (Stock Limits, Projects, Deliveries, Timesheets).
Glow and look	Cyan glow behind dialogs (the top one pulses), and hover, pressed and selected states on cards and buttons. Search boxes, dropdowns and dates share one height. A bug that hid the hover glow was fixed.
Login security	Progressive lockout: every 5 wrong passwords lock sign-in for 3, 5, 10, 15, 30, then 60 minutes. The server enforces it and the login page shows a countdown.
Calendar and dropdowns	The popup scrolls together with its field, with no lag on phones. It no longer runs code while scrolling.

2. Commits

This session (10 commits)

COMMIT	TITLE	FILES	+ / −
`b546664`	Require a Philippine mobile number for customer contact numbers	5	+135 / −12
`c1dbd7b`	Apply one Philippine mobile number rule across customers, employees and applicants	11	+131 / −22
`1431012`	Scroll to the employee list when a card or chart row sets a filter	2	+16 / −7
`86182ec`	Add ambient glow for dialogs and interactive surfaces	3	+165 / −0
`4211043`	Open the matching list and pulse it when a dashboard card is clicked	12	+151 / −31
`09e28b2`	Map more summary cards to filters and standardize field, button and card states	7	+138 / −29
`43cf85d`	Make search boxes, selects and dates the same height as the app's control height	1	+30 / −3
`bdcc15d`	Make the card hover, pressed and selected glow win over the base button hover rule	2	+76 / −1
`833c670`	Lock sign-in for longer after each run of wrong passwords	6	+458 / −28
`ac20cfe`	Place dropdown and calendar popups inside the field's scroll box so they scroll with it	3	+88 / −25

Already in `main` before this session (6 commits, Oct 28 to 29)

COMMIT	TITLE
`a31c0c1`	Move Payroll to the HR module: HR sidebar, /hr/payroll page and HR-group API routes
`95abddd`	Payroll Records are HR only: refuse Admin on the six payroll endpoints
`b191db2`	Payroll reads and timesheet approval are HR only too
`50c9ff8`	Integrate reviewed frontend upload and UI changes
`f93eb87`	Resolve sendForm with an empty object when a 2xx response has no JSON body
`6f22fbc`	Merge pull request #2 (integration/kevin-fixes-upload-fix-v2)

3. Details by topic

Philippine mobile number rule

- Backend: shared `PhoneFormatter::mobile()` accepts digits only (an optional leading `+`). Spaces, dashes and letters are rejected. `9171234567`, `09171234567` and `+639171234567` are all saved as `+639171234567`.
- Customers were mobile-or-landline before. Now new numbers must be mobile. A saved landline can still be edited as long as the number is not changed.
- Frontend: the phone input stops at 10 digits and shows messages such as "Philippine mobile number must start with 9."
- The API no longer accepts numbers with spaces or dashes for employees, applicants and the public form. The forms never sent those, only direct API calls.
- Tests added: `CustomerMobileNumberTest`, `MobileNumberStandardTest`.

Login lockout

- New `App\Services\LoginLockout`. Settings are in `config/atice.php` (`login_lockout`). No new table or migration; it uses the cache.
- Every 5 wrong passwords in a row lock one email on one IP: 3, 5, 10, 15, 30, then 60 minutes (capped). It is checked before the password, so a correct password is also refused while locked.
- Wider nets: the same email from many IPs (20 in an hour, 15-minute lock) and one IP trying many emails (40 in 15 minutes, 15-minute lock). Another person on another IP cannot lock out an employee.
- A successful login resets the count. The reply no longer shows `attempts_remaining`. Known and unknown emails get the same answers.
- Login page: banner and a disabled "Locked m:ss" button. The countdown uses the server's seconds and survives a refresh.
- Tests added: `LoginLockoutTest` (17 tests).

Cards, glow and interaction

- New shared files: `glow.css`, `controls.css`, `lib/modalGlow.js`, `lib/destination.js`.
- A base rule in `index.css` dimmed buttons on hover and overrode the glow. The glow rules now win over it.
- `KpiCard` has new `to` and `dest` props. Clicking a card scrolls to its list and pulses it, and works after navigating to another page.
- Dashboard cards link to: Invoices (overdue filter), HR Employees, Attendance, Leave, Interviews, Customer Deliveries and Receipts, Checker Inventory and Maintenance requests.
- Cards that now filter their own page: Stock Limits (healthy, low, out, over), Projects (open, done, stuck, overdue), Deliveries (in transit), Timesheets (approved, not approved).

- Search boxes, selects and date fields are 40 px tall (44 px on phones) with labels aligned. The Holidays filter row is fixed.

Calendar and dropdown popups

- Cause: the popup was a fixed layer on the page body, moved by a scroll listener that re-read positions and updated React state on every scroll. The page scrolled first and the popup caught up later, which looked like lag on phones.
- Now the popup is placed inside the field's scroll box (page content, modal or panel). The browser scrolls both together. Position is calculated only when it opens or when sizes change.
- On touch, a finger that starts a scroll no longer closes the popup. Only a tap outside does.

4. Files changed (this session: 41 files)

WHERE	FILES
Backend	`AuthController`, `CustomerController`, `EmployeeController`, `ApplicantController`, `PublicApplicationController`, `Biodata`, `PhoneFormatter`, `LoginLockout` (new), `config/atice.php`
Backend tests	`LoginLockoutTest` (new), `CustomerMobileNumberTest` (new), `MobileNumberStandardTest` (new), `PublicApplicationTest` (updated)
Frontend shared	`glow.css`, `controls.css`, `neumorphism.css`, `main.jsx`, `App.jsx`, `Kpi.jsx`, `Insight.jsx`, `PhoneInput.jsx`, `SoftPickers.jsx`, `lib/phone.js`, `lib/destination.js` (new), `lib/modalGlow.js` (new), `lib/loginLock.js` (new)
Frontend pages	`LoginPage`, Admin: `Dashboard`, `CustomersPage`, `EmployeesOverviewPage`, `StockLimitsPage`, `ProjectsPage`, `DeliveriesPage`, `ReceiptsPage`; HR: `HRDashboard`, `TimesheetsPage`; Customer: `CustomerDashboard`, `CustomerDeliveries`, `CustomerReceipts`; Employees: `CheckerDashboard`, `MaintenanceDashboard`

Database: no migrations. Existing customer, employee and user records are not rewritten.

5. What was tested

- **Backend automated tests:** the full suite passed at the last run (331 tests, 2,120 assertions) before the calendar change. The calendar change touched only the frontend.
- **ESLint and the production build:** passed after each change.
- **Browser (test accounts on a throwaway database):** login lockout banner and countdown, calendar scroll in the page and in a modal, four phone widths (320, 360, 390, 430), dark mode, card hover, pressed and selected, field heights on about 35 Admin, HR and Customer pages.

> **Not tested or limited:**
> - Real finger scrolling on a real phone. The browser pane is an emulator.
> - Cards on every HR, Customer and Checker page were checked by shared code, not hovered one by one.
> - Some cards stay informational (no matching list or filter), such as Absences, Needs support and On leave today.
> - Checker, Driver, Salesman and Maintenance pages were not opened in the browser.
> - There is no frontend test runner, so the front-end behavior has no automated tests.

> **For the system analyst:** `kevin-fixes` is 10 commits ahead of `main`. Pull with `git fetch origin`, then `git checkout kevin-fixes`, then `git pull origin kevin-fixes`. The file `ThesisDemo.php` is not part of these

> commits.
